

AGGREGATING FILTERS

ABSTRACT

Access is provided to a resource on a network by
5 installing instructions on the network that define a fixed
level of access to the resource. The instructions are
modified to change the level of access to the resource. The
instructions may be a filter that is installed on a device on
the network. The filter is defined by matching criteria and
10 an action. The matching criteria identify a network address
and perform the action with respect to the network address.
